METHODS FOR SOLVING GENERALIZED PROBLEMS OF SMOOTHING AND EXTRAPOLATION OF RANDOM FUNCTIONS

(Presented by Academician A. A. Dorodnitsyn, 4 IV 1967)

In ⁽¹⁾ the conditions for the existence of a solution of generalized problems of smoothing and extrapolation of random functions were investigated, and a formal apparatus for the analysis of these problems was constructed. In the present note constructive methods are set forth for solving the problems formulated in ⁽¹⁾. The article uses the concepts and preserves the notation and terminology adopted in ⁽¹⁾.

Sec. 1. Let us formulate problem I of smoothing and extrapolation of random functions in terms of the Hilbert space H_r^n .

Problem I. It is required to choose a system of elements $h^\alpha \in G^\alpha$, $\alpha = 1, 2, \dots, n$, on which the quality index of the forecast $R(k^{\alpha\beta}) = \bar{R}(h^\alpha)$ of the random vector-function $\eta(t) = \{\eta^\alpha(t)\}$ at the point $t_0 + t_y$ attains its upper bound.

We associate with problem I problem I^σ of smoothing and extrapolation by the minimum of variance. Let us formulate it in terms of the space H_r^n .

Problem I^σ . It is required in each of the G^α to select an element h_σ^α on which the minimum $k^{\alpha\alpha}$ is attained.

Let us denote the correlation matrices of forecast errors corresponding to the forecast quality indices $R(k^{\alpha\beta})$ and $\sigma_\alpha^2 = k^{\alpha\alpha}$, $\alpha = 1, 2, \dots, n$, respectively, by $\|k_R^{\alpha\beta}\|$ and $\|k_\sigma^{\alpha\beta}\|$.

Theorem 1. *The correlation matrices of the errors of smoothing and extrapolation corresponding to the solutions of problems I and I^σ are related by the relation*

$$\|k_R^{\alpha\beta}\| = \|k_\sigma^{\alpha\beta}\| + \|k_P^{\alpha\beta}\|, \quad (1)$$

where $\|k_P^{\alpha\beta}\|$ is some nonnegative definite symmetric matrix—the matrix of artificial scattering.

Introduce the following notation. $\mathcal{P}_{\alpha\beta}^R(\tau)$, $\mathcal{P}_{\alpha\beta}^\sigma(\tau)$, $\alpha, \beta = 1, 2, \dots, n$, are the weight functions corresponding to the solutions of problems I and I^σ , respectively; $w(t_0, \tau) = w(\tau)$ is an arbitrary function belonging to $H^{(K)}(t_0, T)$, distinct from the identically zero function and satisfying the conditions

$$\int_0^T \psi_j^\alpha(t_0 - \tau) w(\tau) d\tau = 0, \quad \alpha = 1, 2, \dots, n; \quad j = 1, 2, \dots, r.$$

Let, moreover,

$$a_{\alpha\beta} = \int_0^T \int_0^T k_{\xi^\alpha, \xi^\beta}(t_0 - \tau_1, t_0 - \tau_2) w(\tau_1) w(\tau_2) d\tau_1 d\tau_2. \quad (2)$$

Define the matrix of numbers $\|\chi_{\alpha\beta}\|$, $\alpha, \beta = 1, 2, \dots, n$, by the equation

$$\|\chi_{\beta\mu}\| \|a_{\mu\nu}\| \|\chi_{\alpha\nu}\|^T = \|k_R^{\alpha\beta}\| - \|k_\sigma^{\alpha\beta}\| = \|k_P^{\alpha\beta}\|. \quad (3)$$

System (3) has a solution (more precisely, an infinite set of solutions), since there always exists a transformation with matrix $\|\chi_{\beta\mu}\|$ which transforms the positive definite quadratic form with matrix $\|a_{\mu\nu}\|$ into the nonnegative definite quadratic form with matrix $\|k_P^{\alpha\beta}\|$.

The matrices satisfying equation (3) are

$$\|x_{\alpha\beta}\| = \|c_{\alpha\mu}\| \|d_{\mu\nu}\| \|h_{\nu\lambda}\| \|c_{\lambda\beta}\|^{-1}. \quad (4)$$

Here $\|c_{\alpha\beta}\|$ is a nonsingular matrix which simultaneously reduces the matrix $\|a_{\alpha\beta}\|$ to normal form and the matrix $\|k_P^{\alpha\beta}\|$ to canonical form:

$$\|c_{\alpha\mu}\| \|a_{\mu\nu}\| \|c_{\alpha\nu}\|^T = E_n,$$

$$\|c_{\alpha\mu}\| \|k_P^{\mu\nu}\| \|c_{\alpha\nu}\| = \begin{vmatrix} g_1 & 0 & \dots & 0 \\ 0 & g_2 & \dots & 0 \\ \vdots & \vdots & \dots & \vdots \\ 0 & 0 & \dots & g_n \end{vmatrix},$$

$$\|h_{\nu\lambda}\| = \begin{vmatrix} \sqrt{g_1} & 0 & \dots & 0 \\ 0 & \sqrt{g_2} & \dots & 0 \\ \vdots & \vdots & \dots & \vdots \\ 0 & 0 & \dots & \sqrt{g_n} \end{vmatrix},$$

$\|d_{\mu\nu}\|$ is an arbitrary orthogonal matrix.

There is the following relation between the weight functions determining the solutions of Problems I and I^σ .

Theorem 2. *The weight functions on which the solutions of Problems I and I^σ are attained are connected by the formulas*

$$\mathcal{P}_{\alpha\beta}^R = \mathcal{P}_{\alpha\beta}^\sigma + x_{\alpha\beta}w(\tau), \quad \alpha, \beta = 1, 2, \dots, n. \quad (5)$$

2.

Let us formulate Problem II of smoothing and extrapolation in terms of the spaces H^n and $H^{(K)}(t_0, T)$.

Problem II. It is required to choose a random vector $\zeta = \{\zeta^\alpha\} \subset L = L^n(t_0, T) \subset H^n$ (or, equivalently, a system of weight functions $\mathcal{P}_{\alpha\beta}(t_0, \tau) \in H^{(K)}(t_0, T)$, $\alpha, \beta = 1, 2, \dots, n$), for which the quality criterion of the prediction

$$R(m^\alpha, k^{\alpha\beta}) = \bar{R}(\zeta^\alpha) = R(\mathcal{P}_{\alpha\beta})$$

of the random vector-function $\eta(t) = \{\eta^\alpha(t)\}$ at the point $t_0 + t_y$ attains its upper bound.

Let us select in $L = L^n(t_0, T)$ the set of elements G_c of the form $\xi = \xi_0 + c$ ($c = \xi$) and associate with Problem II the auxiliary Problems II^{σ_1} and II^{σ_2} .

Problem II^{σ_1} . It is required, for each α , $\alpha = 1, 2, \dots, n$, to find a random variable $\xi^\alpha \in G_0$ on which the minimum of

$$M[\eta^\alpha(t_0 + t_y) - \xi^\alpha]^2$$

is attained.

Problem II^{σ_2} . It is required to find a random vector $\xi \in G_1$ on which the minimum of $M[\xi]^2$ is attained.

Introduce the following notation: $\xi_R^\alpha, \xi_{\sigma_1}^\alpha, \xi_{\sigma_2}^\alpha$ are random variables determining the solutions of Problems II, II^{σ_1} , and II^{σ_2} , respectively; $m_R^\alpha, k_R^{\alpha\beta}$ are the first and second moments of the smoothing and extrapolation errors corresponding to the solution of Problem II;

$$c_R^\alpha = M\xi_R^\alpha = M\eta^\alpha - m_R^\alpha; \quad k_{\sigma_1}^{\alpha\beta} = M\{[\eta^\alpha(t_0 + t_y) - \xi_{\sigma_1}^\alpha][\eta^\beta(t_0 + t_y) - \xi_{\sigma_1}^\beta]\};$$

$$k_{\sigma_2} = M(\xi_{\sigma_2} - 1)^2; \quad k_{\sigma_1\sigma_2}^\alpha = M\{\xi_{\sigma_1}^\alpha(\xi_{\sigma_2} - 1)\}.$$

Theorem 3. *The statistical characteristics of the solutions of Problems II, II^{σ_1} , and II^{σ_2} are connected by the formulas*

$$\|k_R^{\alpha\beta}\| = \|k_{\sigma_1}^{\alpha\beta}\| - \|c_R^\alpha k_{\sigma_1\sigma_2}^\beta + c_R^\beta k_{\sigma_1\sigma_2}^\alpha\| + \|c_R^\alpha c_R^\beta k_{\sigma_2}\| + \|k_P^{\alpha\beta}\|, \quad (6)$$

$$m_R^\alpha = \bar{\eta}^\alpha - c_R^\alpha, \quad \alpha, \beta = 1, 2, \dots, n, \quad (7)$$

where $\|k_P^{\alpha\beta}\|$ is a symmetric nonnegative definite matrix—the matrix of artificial scattering.

Let $\mathcal{P}_{\alpha\beta}^R(\tau)$, $\mathcal{P}_{\alpha\beta}^{\sigma_1}(\tau)$, and $\mathcal{P}_{\alpha\beta}^{\sigma_2}(\tau)$ be the weight functions corresponding to the solutions of problems II, II^{σ_1} , and II^{σ_2} , and let $w(\tau)$ be an arbitrary function, not identically zero, satisfying the conditions

$$\int_0^T M\xi^\alpha(t_0 - \tau)w(\tau) d\tau = 0, \quad \alpha = 1, 2, \dots, n.$$

Suppose, in addition, that the parameters $\varkappa_{\alpha\beta}$ are computed from the equations

$$\sum_{\mu=1}^n \sum_{\nu=1}^n \varkappa_{\alpha\mu} \varkappa_{\beta\nu} a_{\mu\nu} = k_P^{\alpha\beta},$$

where $\|k_P^{\alpha\beta}\|$ satisfies equation (6), and the constants $a_{\mu\nu}$ are computed from $k_{\xi^\alpha, \xi^\beta}(t_1, t_2)$ and $w(\tau)$ by formulas (2).

Theorem 4. *The weight functions for which the solutions of problems II, II^{σ_1} , and II^{σ_2} are attained are connected by the relations*

$$\mathcal{P}_{\alpha\beta}^R(\tau) = \mathcal{P}_{\alpha\beta}^{\sigma_1}(\tau) + c_R^\alpha \mathcal{P}_{\beta}^{\sigma_2}(\tau) + \varkappa_{\alpha\beta} W(\tau), \quad \alpha, \beta = 1, 2, \dots, n. \quad (8)$$

Theorems 1–4 reduce the solution of the complicated variational problems I and II to the analysis of the substantially simpler variational problems I^σ , II^{σ_1} , and II^{σ_2} , considered in the literature, and to the investigation for an extremum of the functions $R(k^{\alpha\beta}) = R^0(k_P^{\alpha\beta})$ and $R(m^\alpha, k^{\alpha\beta}) = R^0(c^\alpha, k_P^{\alpha\beta})$, respectively.
