ELECTROMAGNETIC POTENTIALS AND THEIR GAUGE IN AN ANISOTROPIC, DISPERSIVE, AND MOVING MEDIUM

(Presented by Academician B. P. Konstantinov on 26 V 1966)

If the electromagnetic-field equation in four-dimensional form for the 4-tensors $F_{ik}(\mathbf{E}, \mathbf{B})$ and $\Phi_{ik}(\mathbf{D}, \mathbf{H})$ (see (1), § 33) is written for the Fourier amplitudes of these quantities, f_{ik} and φ_{ik} , respectively, then in a Galilean coordinate system with metric tensor

$$g_{ik} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & -1 \end{pmatrix}$$

they have the form

$$\varphi^{ik} k_k = -i \frac{4\pi}{c} j^i, \quad (1)$$

$$\bar{f}^{ik} k_k = 0, \quad (2)$$

$$\varphi^{ik} = S^{ik}_{sr} \bar{f}^{sr}, \quad (3)$$

where $\bar{f}^{ik}$ is the pseudo-4-tensor dual to f_{ik} and related to it by the relation $\bar{f}^{ik} = 1/2 \varepsilon^{ikmn} f_{mn}$; k_i is the wave 4-vector; j^i is the Fourier amplitude of the 4-vector of current density; S^{ik}_{sr} is the material pseudo-4-tensor of permeability, antisymmetric in the upper pair and in the lower pair of indices, first introduced by I. E. Tamm ⁽²⁾. Here and below, indices denoted by letters of the Latin alphabet take the values 1, 2, 3, 0 and number all coordinates of 4-space; summation is implied over twice repeated indices; ε^{iksr} are the contravariant components of the unit completely antisymmetric pseudo-4-tensor ⁽³⁾, §83, whose covariant components are such that $\varepsilon_{1230} = 1$ and $\varepsilon^{iksr} = -\varepsilon_{iksr}$.

Equation (2) can be satisfied by putting

$$\bar{f}^{ik} = iN^{iks}k_s, \quad (4)$$

where N^{iks} is a pseudo-4-tensor antisymmetric in all three indices. In the definition of N^{iks} there is an ambiguity: to N^{iks} one may, without changing $\bar{f}^{ik}$, add $T^{iksr}k_r$, where the pseudo-4-tensor T^{iksr} is arbitrary and completely antisymmetric, and therefore one may always put $T^{iksr} = T \cdot \varepsilon^{iksr}$, where T is a true 4-scalar. We introduce the 4-vector a_r , dual to the pseudo-4-tensor N^{iks} and being the Fourier amplitude of the 4-vector potential:

$$N^{iks} = \varepsilon^{iksr}a_r. \quad (5)$$

Since the pseudo-4-tensor N^{iks} is defined ambiguously, one may impose on the components N^{iks} , and consequently also on the components a_r , one entirely arbitrary scalar condition, which merely restricts the arbitrariness in the choice of the 4-scalar T .

Substituting (5) into (4), forming φ^{ik} with the aid of (3), and using (1), we obtain the equation for the 4-vector potential

$$T^{in}a_n = -\frac{4\pi}{c}j^i, \quad (6)$$

where

$$T^{in} = S_{..sr}^{ik}\varepsilon^{sr mn}k_kk_m = R^{ikmn}k_kk_m \quad (7)$$

is a true 4-tensor. Here the 4-tensor

$$R^{ikmn} = S_{..sr}^{ik}\varepsilon^{sr mn}, \quad (8)$$

has been introduced; it is antisymmetric in the first pair and in the second pair of indices and establishes the relation between φ^{ik} and f_{mn}

$$\varphi^{ik} = 1/2R^{ikmn}f_{mn}. \quad (9)$$

The relation inverse to (8) has the form

$$S_{..sr}^{ik} = -1/4R^{ikmn}\varepsilon_{mn sr}. \quad (10)$$

For stationary media the components of the 4-tensor R^{ikmn} are expressed in terms of the components of the 3-tensors of the electric $\varepsilon^{\alpha\beta}$ and magnetic $\mu^{\alpha\beta}$ permeabilities

$$R^{\alpha\beta\gamma 0} = 0, \quad R^{\alpha\beta\gamma\sigma} = \varepsilon^{\alpha\beta\lambda} \mu_{\lambda\nu}^{-1} \varepsilon^{\nu\gamma\sigma}, \quad R^{\alpha 0\beta\gamma} = 0, \quad R^{\alpha 0\sigma 0} = -\varepsilon^{\alpha\sigma}. \quad (11)$$

Indices denoted by letters of the Greek alphabet take the values 1, 2, 3 and number the spatial coordinates. In three-dimensional space the unit completely antisymmetric pseudo-3-tensor $\varepsilon^{\alpha\beta\gamma}$ and $\varepsilon_{\alpha\beta\gamma}$ is related to the analogous 4-tensor in four-dimensional space by the relations

$$\varepsilon^{\alpha\beta\gamma} \equiv \varepsilon^{\alpha\beta\gamma 0}, \quad \varepsilon_{\alpha\beta\gamma} \equiv \varepsilon_{\alpha\beta\gamma 0}.$$

Introduce the 4-tensor

$$G_{ik} = 1/4 \varepsilon_{ibsr} k_l R^{lspr} k_a R^{abmt} \varepsilon_{mtpk} \quad (12)$$

and multiply both sides of equation (6) by it, summing over the index i . Then we obtain

$$T^{in} a_n G_{ik} = -\frac{4\pi}{c} j^i G_{ik}$$

or

$$C_k{}^n a_n = -\frac{4\pi}{c} j^i G_{ik}, \quad (13)$$

where

$$C_k{}^n = G_{ik} T^{in}. \quad (14)$$

Using (7) and (8), for $C_k{}^n$ we obtain

$$C_k{}^n = A_{vvg}^{pmt} \varepsilon_{mtpk} \varepsilon^{vogn}, \quad (15)$$

where the 4-tensor

$$A_{vvg}^{pmt} = 1/4 \varepsilon_{ibsr} k_l R^{lspr} k_a R^{abmt} S_{..vbk}^{if} k_f k_g, \quad (16)$$

has been introduced; it is antisymmetric in the first pair of lower and in the second pair of upper indices. By virtue of the identity

$$\varepsilon_{mtpk} \varepsilon^{vogn} \equiv \varepsilon_{mtps} \varepsilon^{vogs} \delta_k^n + \varepsilon_{mtps} \varepsilon^{vwsn} \delta_k^g + \varepsilon_{mtps} \varepsilon^{vsgn} \delta_k^w + \varepsilon_{mtps} \varepsilon^{swgn} \delta_k^v \quad (17)$$

equality (15) takes the form

$$C_k^n = A_{vug}^{pmt} \varepsilon_{mtps} \varepsilon^{vugs} \delta_k^n + A_{vuk}^{pmt} \varepsilon_{mtps} \varepsilon^{vwsn} - 2A_{kwg}^{pmt} \varepsilon_{mtps} \varepsilon^{nugs}. \quad (18)$$

The last term in (18) can be transformed using the relation

$$\varepsilon_{mtps} \varepsilon^{nugs} = -(\delta_m^n \delta_t^w \delta_p^g + \delta_m^w \delta_t^g \delta_p^n + \delta_m^g \delta_t^n \delta_p^w - \delta_m^n \delta_t^g \delta_p^w - \delta_m^w \delta_t^n \delta_p^g - \delta_m^g \delta_t^w \delta_p^n) \quad (19)$$

and the symmetry properties of the 4-tensor A_{vug}^{pmt} noted above. As a result we obtain

$$-2A_{kwg}^{pmt} \varepsilon_{mtps} \varepsilon^{nugs} = -4A_{kwg}^{gwn} + 4A_{kwg}^{nwg} + 4A_{wkg}^{wng}. \quad (20)$$

It is not difficult to verify that the first term in (20) is equal to zero

$$-4A_{kwg}^{gwn} = \varepsilon_{ibsr} k_l R^{lsrg} k_g k_a R^{abwn} k_f S_{..kw}^{if..} = 0. \quad (21)$$

For this, instead of $k_l R^{lsrg} k_g$, one must substitute, in accordance with (8), $k_l S_{..vm}^{ls..} \varepsilon^{vmrg} k_g$, and expand the product $\varepsilon_{ibsr} \varepsilon^{vmrg}$ by formula (19); then in each of the 6 terms there will be present the product of a symmetric 4-tensor of rank 2 with a 4-tensor antisymmetric in the same indices.

It can be shown that the 3rd term in (20)

$$4A_{wkg}^{wng} = \varepsilon_{ibsr} k_l R^{lswr} k_f S_{..wk}^{if..} k_a R^{abng} k_g = -C_k^n. \quad (22)$$

To convince oneself of this, note that the last three factors in (22) form, according to (7), the 4-tensor T^{bn} , and, if the factor $S_{..wk}^{if..}$ is transformed by formula (10), then all the factors standing before T^{bn} form, according to (12), G_{bk} , and on the basis of (14)

$$-G_{bk} T^{bn} = -C_k^n.$$

Let us transform the second term in (20)

$$4A_{kwg}^{nwg} = \varepsilon_{ibsr} k_l R^{lsnr} k_a R^{abwg} k_g k_f S_{..kw}^{if..}. \quad (23)$$

If in (23) we use the equality $R^{abwg} = S_{..vm}^{ab..} \varepsilon^{vmwg}$ (see (8)), and then the identity analogous to (17):

$$\begin{aligned}\varepsilon_{ibsr}\varepsilon^{vmwg} &\equiv \varepsilon_{pbsr}\varepsilon^{vmwp}\delta_i^g + \varepsilon_{ibsp}\varepsilon^{vmwp}\delta_r^g, \\ &+ \varepsilon_{ibpr}\varepsilon^{vmwp}\delta_s^g + \varepsilon_{ibsp}\varepsilon^{vmwp}\delta_r^g,\end{aligned}\quad (24)$$

then it is obvious that, of the four terms formed in (23), three turn into zero because in each there is present the product of a 4-tensor symmetric in two indices with a 4-tensor antisymmetric in the same indices: in one, $k_a k_b S_{..vm}^{ab..}$, in another, $k_l k_s R^{lsnr}$, and in the third, $k_i k_f S_{..kw}^{if..}$. Then

$$4A_{kwg}^{nwg} = \varepsilon_{ibsp} k_a S_{..vm}^{ab..} \varepsilon^{vmwp} k_f S_{..lw}^{if..} k_l R^{lsnr} k_r.$$

If one notes that, according to (8), $S_{..vm}^{ab..} \varepsilon^{vmwp} = R^{abwp}$, then the resulting expression does not differ from that which stands in (22) after the first equals sign. Consequently,

$$4A_{kwg}^{nwg} = -C_k^n. \quad (25)$$

Taking into account (21) and (25), formula (18) takes the form

$$C_k^n = V\delta_k^n + k_k P^n, \quad (26)$$

where the 4-scalar $V = \frac{1}{3} A_{wug}^{pmt} \varepsilon_{mtps} \varepsilon^{vugs}$ and the 4-vector P^n are introduced, the latter having the form

$$P^n = \frac{1}{3} G_{is} R^{ifsn} k_f. \quad (27)$$

Substituting (26) into (13), we obtain

$$V\delta_k^n a_n + k_k P^n a_n = -\frac{4\pi}{c} j^i G_{ik}. \quad (28)$$

Since one scalar condition may be imposed on a_n , choosing it in the form $P^n a_n = 0$, we obtain from (28) the solution for the 4-vector potential

$$a_k = -\frac{4\pi}{c} \frac{j^i G_{ik}}{V}. \quad (29)$$

The equality $P^n a_n = 0$ is a generalization of the Lorentz condition in a material medium that is anisotropic and dispersive with respect to its electric and magnetic properties. Using (11), we obtain the components of the 4-vector P^n for stationary media:

$$\begin{aligned}
 P^0 &= \frac{1}{3} G_{is} R^{ifs0} k_f = \frac{1}{2} k_0 T^{00} \varepsilon^{\sigma\nu} \mu_{\sigma\nu}^{-1} - \frac{1}{2} k_0 g^\alpha \mu_{\alpha\nu}^{-1} p^\nu - k_0^3 |\varepsilon^{\alpha\beta}|; \\
 P^\alpha &= \frac{1}{3} G_{is} R^{ifs\alpha} k_f = \\
 &= -\frac{1}{2} \frac{k_\sigma \mu^{\sigma\nu} k_\nu}{|\mu^{\alpha\beta}|} p^\alpha + \frac{1}{2} k_0^2 \varepsilon^{\sigma\nu} \mu_{\sigma\nu}^{-1} p^\alpha - \frac{1}{2} k_0^2 \mu_{\sigma\nu}^{-1} p^\nu \varepsilon^{\sigma\alpha} - \frac{1}{2} T^{00} \frac{k_\sigma \mu^{\sigma\alpha}}{|\mu^{\alpha\beta}|}, \quad (30)
 \end{aligned}$$

where the notations $p^\alpha = k_\beta \varepsilon^{\beta\alpha}$, $g^\alpha = \varepsilon^{\alpha\beta} k_\beta$, $T^{00} = k_\sigma \varepsilon^{\sigma\nu} k_\nu$ have been introduced; $|\mu^{\alpha\beta}|$ and $|\varepsilon^{\alpha\beta}|$ are determinants composed of the components of the 3-tensors $\mu^{\alpha\beta}$ and $\varepsilon^{\alpha\beta}$, respectively.

For an isotropic medium the equality $P^n a_n = 0$ becomes

$$\frac{\varepsilon}{\mu} \left(\varepsilon k_0^2 - \frac{k_\alpha k^\alpha}{\mu} \right) (k^\alpha a_\alpha - \varepsilon \mu k_0 a_0) = 0,$$

which is satisfied under the condition

$$k^\alpha a_\alpha - \varepsilon \mu k_0 a_0 = 0,$$

or, taking into account that $k_0 = -\omega/c$, $a_0 = -\varphi$,

$$\mathbf{k} \cdot \mathbf{a} - \frac{\omega \varepsilon \mu}{c} \varphi = 0. \quad (31)$$

Since $\mathbf{a}$ is the Fourier amplitude of the 3-vector potential of the electromagnetic field $\mathbf{A}$, and φ is the Fourier amplitude of the scalar potential Φ , equality (31) obviously corresponds to the condition

$$\operatorname{div} \mathbf{A} + \frac{\varepsilon \mu}{c} \frac{\partial \Phi}{\partial t} = 0.$$

The solution (29) was first obtained by one of the authors by a more cumbersome route without formulating the gauge condition for the 4-potential [4]. Of course, the solution presented here, based on the use of the 4-tensor G_{ik} , and the gauge condition could have been found only after carrying out the aforementioned cumbersome solution, since the method of constructing the 4-tensor G_{ik} is not evident in advance.
